

PostgreSQL

How do I restore a PostgreSQL backup?

We take automated backups each of your PostgreSQL databases.

Backups are daily, weekly, and monthly with retention of 7 days, 5 weeks, and 3 months.

Each database is backed up individually in both Plain Text and Custom format.

To restore a scheduled backup, click the "PostgreSQL Restore" icon.

Select the database and date you would like to restore to and click the "Restore Database" link.

In addition to restoring our scheduled backups, you can also take on-demand backups and restore them at any time via the control panel by clicking the "PostgreSQL Snapshots" icon.

Of course, you can also restore databases manually via PGSQL as well as phpPgAdmin.
